

Naturally, "payment" is the table with the most connections. The staff confirms the payment, the customer pays, and you can either buy tickets or concessions. If I have time today, I'll look into combo tables so that ticket_id and concessions_id are combined into one thought. I added the customer_id to the ticket table so that if a customer loses their ticket, that they are connected directly to the ticket. And, of course, it only made sense for a ticket to be able to know what movie it was for.
